I am trying to install the Openvz on a Dell R720,based on raid and LVM.

OS : CentOS 5.9 (vmlinuz-2.6.18-348.el5)
OpenVZ: 2.6.18-194.3.1.el5.028stab069.6

First I installed the CentOS5.9 on the R720, it's running all right.
Then I install the OpenVZ kernel and reboot the Server,
kernel panic occurred ,the booting message shows that the
LVM was not found...

I attached the console capture,
and the /etc/modprobe.conf is as follows

/etc/modprobe.conf
alias eth0 ixgbe
alias eth1 ixgbe
alias eth2 igb
alias eth3 igb
alias eth4 igb
alias eth5 igb
alias eth6 igb
alias eth7 igb
alias scsi_hostadapter megaraid_sas
alias scsi_hostadapter1 ahci
----

so I had to chage back to the boot kernel (vmlinuz-2.6.18-348.el5).It booted .
I also tried to change the megaraid_sas.ko of the initrd-2.6.18-194.3.1.el5.028stab069.6.img, and
rebooted again,
still failed.
