personally I also tend to remove stock kernel, but as a matter of my answer- it is only quick reply for people which didn't/don't want to remove stock kernel.
Also there can be situations when you debug problems, and in process you install stock kernel (to verify is this openvz specific problem or general problem), than you can also get this situation.

and...
in fact if I remember everything ok, there was some situations when it still goes to dependency hell. after that this wiki article came in.
Also keep in mind that openvz kernel is some time behind of stock kernel, so stock kernel-firmware package can have fixes or improovements that still not available in openvz vzkernel-firmware package.

thats my opinion, and thus I remove stock kernel, but setup as in wiki article.
