Hey,

i'm running 3 vms on my openvz host. Each one is a debian-7.0-x86_64 template. I did not update anythiny on the host as far as i know, but suddenly the host gets a kernel panic when starting the third vm. The other ones are working fine. i screenshoted the panic message, but this does not say anything to me. Maybe someboby has an idea?

I was running kernel 2.6.32-openvz-042stab085.16-amd64 and upgraded to 2.6.32-openvz-042stab085.20.amd64. But this changed nothing.

Any hints are seriously welcome
Thanks !!!
