My definitions of the words deprecated and supported are a bit different than yours...

Sure, simfs can work on other file systems as of now, but I think having user quotas in CTs is a prerequisite for labeling file systems as supported. Quotas work only on ext2/3/4 and that alone makes anything but ext4 unusable for many openvz use cases.

Don't get me wrong, having working quotas and BtrFS or ZFS specific functionality would be great. I just don't think openvz project has enough resources to accomplish all this.
