## Subject: DNS Problem
Posted by markjcc on Tue, 27 May 2014 08:36:03 GMT

Every new VM I make on SolusVM with OpenVZ, once it boot's the nameserver's don't work and yum won't work so does ping

I have to run this script each and every time I make a new VPS
See below for script

The /etc/resolv.conf on the Slave is.
nameserver 8.8.8.8
nameserver 8.8.4.4

What's the matter or resolution here.

This is the script I have to run everytime

```
#!/bin/sh

VPS="$(cd /vz/private/ && echo *)"
 for VPS in $VPS; do
  vzctl set $VPS --nameserver 8.8.8.8 --nameserver 8.8.4.4 --save
 done;
```

Also /etc/resolv.conf on the VM is empty.
