Hi,

I gave access to a partition on a VE with this :

```
vzctl set 100 --capability sys_rawio:on --devnode sda5:rw --save
```

I can succcessfully mount /dev/sda5 in the VE as long sda5 is in ext4.

I would like to mount it while it is in XFS but I have this message when I try to mount:
unknown filesystem type 'xfs'

Kernel module xfs is loaded on the HN, is it possible to give access to this module to the VE ?

Thank you in advance.

Best regards.
