Hi everybody,

I'm looking for help about a VPN.

I have a VPS @ OVH, i would want to use my HideMyAss VPN on it, i'm looking for that about one week...

In short, if i curl checkip.dyndns.com i have 37.XXX.XX.XXX
I would want to, on my VPS when i connect to a remote VPN server, have a different IP when i curl checkip.dyndns.com.

I believe it is possible... not with masquerade (cause venet0) but with SNAT, i tried many iptables on this site and others without success...

ip_forward in my /etc/sysctrl.conf is activated...

When connecting, i've got a message like:
NOTE: unable to redirect default gateway -- Cannot read current default gateway from system
OVH tell me it's not important but i'm not so sure...

If somebody have an idea, i will be glad to test it.

Thank you very much

Edit history:
- Change ip_worward by ip_forward, misspelling correction.
