
Subject: CentOS 6 - /dev/shm Not Mounting at Boot

Hey folks, I just registered and I've got an unusual issue on a couple of CentOS 6 x64 templates I've been running. For some reason both of these VMs quit mounting /dev/shm as a tmpfs yesterday. I've checked /etc/fstab and the correct entries are still there.

```
tmpfs /dev/shm tmpfs defaults 0 0
```

Both of these setups are VPSs that I have hosted and the hosting provider has never seen anything like this happen. I'm hoping someone here has an idea because even the backups from last month have this issue and I'd rather not rebuild.

Thanks
