Subject: CentOS 6 - /dev/shm Not Mounting at Boot
Posted by absolutesantaja on Wed, 27 Aug 2014 12:19:00 GMT

Hey folks, I just registered and I've got an unusual issue on a couple of CentOS 6 x64 templates I've been running. For some reason both of these VMs quit mounting /dev/shm as a tempfs yesterday. I've checked /etc/fstab and the correct entries are still there.

tempfs /dev/shm tmpfs   defaults 0 0

Both of theses setups are VPSs that I have hosted and the hosting provider has never seen anything like this happen. I'm hoping someone here has an idea because even the backups from last month have this issue and I'd rather not rebuild.

Thanks
