I am new into this, but have searched Google for it and cannot find a real answer to my problem.

I have installed a minimal CentOS 6.5 on the server and installed OpenVZ kernel, edited some files and after that i could reboot according to the manual. So i did, but after that i cannot connect anymore to port 22.

```
$ ssh -v root@192.168.192.21
OpenSSH_6.2p2, OpenSSL 0.9.8r 8 Dec 2011
debug1: Reading configuration data /etc/ssh_config
debug1: /etc/ssh_config line 20: Applying options for *
debug1: Connecting to 192.168.192.21 [192.168.192.21] port 22.
debug1: connect to address 192.168.192.21 port 22: Connection refused
ssh: connect to host 192.168.192.21 port 22: Connection refused
```

First of all, why is this? This happened for the second time, so I guess OpenVZ does this?
Second, how can i repair this? Or is there another port configured?

Hope somebody can help me with this?
