hello everyone,

I have a problem on a CT at boot startup. When i do vzctl start 123, the CT starts, but the boot sequence does not start ; so the CT is started with around 7 process (just udev and bash)
When I enter in CT, i can launch the command 'init 2', and then the boot sequence starts correctly, and my various programs (ssh, ...) starts on this CT.

When i use the console (vzctl console 123), i have nothing in it , excepted a 'mountall failed' message...

I try to start a debian default template on the same host, and it starts good (boot sequence OK, everything ok in the console)

Did someone already expected something like this ?

Thanks
Thomas

proxmox version : 3.3
