no solutions found so far.

i ended up reversing the logic:

- you can mount the HDD drive under /vz/ and move all your vz containers onto the new mount
- then have a folder from the SSD bind mounted into the VZ/var/mysql and just have all the databases on SSD
- mysql usage is then calculated not from quota but from mysql (separate setting from Cpanel)

i would have liked to have the whole OS on ssd but it is not possible due to how OpenVZ works.
