I followed these instructions to T (cloudlinux) and I get this when I try to set the permission on my master server `vzctl set 701 --devnodes lve:rw --save`
The `/dev/lve` is not block or character device
Bad parameter for `--devnodes: lve:rw` I can't tell you how agervating this is to actually follow instructions and still fails granted I have feeling I'm posting this on the wrong site but lets hope someone here knows how to get cloudlinux working. I'll make post on cloudlinux as well
