Was VPS in running state when you tried to do --bind mount?
/vps/v1 is 'private' or 'root' VPS directory?

To do correct bind mount you need:
1. Start VPS
2. mount --bind /root_VPS_directory/etc /root_VPS_directory/mnt

Or you can add mounting/umounting to VEID.mount/.umount scripts and vzctl will mount/umount your directories on VPS start/stop.
