
Subject: vmdump bwlmit not run

Hello, all is fine with my containers running in Proxmox, but I have some OpenVZ HostNodes installed directly in CentOS 6, the bwlmit option don't take effect.

I run allways in snapshot mode.

```
vmdump --dumpdir /sata/vmdump --tmpdir /sata/vmdump --snapshot --compress --bwlmit 5120 100
```

```
vmdump --dumpdir /sata/vmdump --tmpdir /sata/vmdump --snapshot --compress --bwlmit 51200 100
```

In both, the result is the same: Total bytes written: 1659156480 (1.6GiB, 17MiB/s)
In the first, don't take care about the 5MB/s limit
In the second, don't get the performance specified.

Allways is around 15 MB/s

I can ensure that is not a issue on disk IO performance.

I've tested with many versions of vmdump (the vmdump 1.2-4, provided in OpenVZ repo and the one provided on the SolusVM repo), and same result with all.

It's a bug?

Thanks!!!
