---

i tried to do live migration for openvz container with debian 6.0.10 operating system hosted on ubuntu machine to another machine with the similar configuration .  
tried to migrate container with running process (chat program client and server )but the migration failed due to the following error

do live migration with zero down time using this command :

```
vzmigrate --online <destination machine ip > <container id >
```

this error happened

Starting live migration of CT 102 to 192.168.1.110

Error: foreign process 701/3934(vzctl) inside CT (e.g. vzctl enter or vzctl exec).

Error: foreign process 702/3935(bash) inside CT (e.g. vzctl enter or vzctl exec).

Error: foreign process 707/3943(thread) inside CT (e.g. vzctl enter or vzctl exec).

Insufficient CPU capabilities: can't migrate

Error: Error: CPU capabilities check failed!

Error: Destination node CPU is not compatible

Error: Can't continue live migration

note :

1- i want to migrate container with process running,

2- live migration successfully when i terminated the running processes
