i tried to do live migration for openvz container with debian 6.0.10 operating system hosted on ubuntu machine to another machine with the similar configuration .
tried to migrate container with running process (chat program client and server)but the migration failed due to the following error

do live migration with zero down time using this command :

```
vzmigrate --online <destination machine ip > <container id >
```

this error happened

Starting live migration of CT 102 to 192.168.1.110

Error: foreign process 701/3934(vzctl) inside CT (e.g. vzctl enter or vzctl exec).

Error: foreign process 702/3935(bash) inside CT (e.g. vzctl enter or vzctl exec).

Error: foreign process 707/3943(thread) inside CT (e.g. vzctl enter or vzctl exec).

Insufficient CPU capabilities: can't migrate

Error: Error: CPU capabilities check failed!

Error: Destination node CPU is not compatible

Error: Can't continue live migration

note :

1- i want to migrate container with process running,

2- live migration successfully when i terminated the running processes
