---

I have issue in openvz container whenever create new container it stay still reachable in network till its not rebooted whenever i reboot the vz container i lost the network connectivity with it.

When i try to start the container from shell i always get below message and i lost the network connectivity with it.

I found some other issue like if i assign a new IP to container which never used then that IP also reachable but till the container not rebooted as many IP i can use same issue happened with all of them.

Please suggest me why this happens-

```
vzctl restart 102
Restarting container
Stopping container ...
Container was stopped
Container is unmounted
Starting container...
Container is mounted
Adding IP address(es): x.x.x.x
arpsend: x.x.x.x is detected on another computer : b0:83:fe:de:a8:0c
vps-net_add WARNING: arpsend -c 1 -w 1 -D -e x.x.x.x eth2 FAILED
