---

I have 500G container and first vzmigrate run is failed. After few days I want to re-migrate it without copying 500G over the wire again. Is there a way to do it?

I think, it may be technically possible, like doing snapshot and then ploop copy man page says it's copying 'top delta', i.e. latest snapshot. But this does not mean ofc that vzmigrate is smart enough to do all required the ploop-magic.

Somebody tried to achieve this?
