
Subject: Local-net only one way traffic?

I have a really weird issue. I have two bridges setup, extbr0 and intbr0 with each being either on an external network or internal. I'm using venet (not veth). In the VE I have venet0:0 and venet0:1 with the internal and external networks.

Here's the weird thing. From inside the VE, I can access the internet, and I can access the VE from the internet. From the local network I can access the VE. From the VE, I can ping the local network gateway, but I cannot ping or access anything beyond that. Even when I've ssh'd into the VE from another local machine, I still cannot ping that local machine from inside the VE.

From the Host I can access everything.

I can't figure this out. It's as if there's a firewall, but iptables isn't setup anywhere.

I'm using the default OpenVZ in Centos 6.
