Hello,

We are looking to set up VPS hosting for business - we will sell virtual servers to customers.

We are trying to decide on platforms to use and would be glad if you could share your opinion on what management software works best with your platform.

Would it be any of FluidVM, SolusVM, Cloudmin, Virtualizor, HyperVM? Or would it be one not mentioned here?

Would really appreciate your reply, and any extra information you may give.

Thank you

Ugorji
