
Subject: OpenVZ Container and Diskpace

Hi,

I have a server with LVM partitions for eacht openvz container.

I have a LVM partition of 10 GB with a container with diskpace of 10G

Recently I was getting error messages when copying files to the container using sftp.
In the logs: it said write failed. I checked the file permissions and they were ok.

I checked the diskpace with the df -h command and it returned:

```
/dev/ploop12570p1 9.8G 3.6G 5.8G 38% /
```

So I am only using 38% of the available space.

I couldn't find the problem. When I tried to update apt using apt-get update, I received and error message that the disk was full.

That was strange since df -h was showing only 38% diskpace usage.

I extended the LVM volume using LVEXTEND.

I set the new diskpace of the container using vzctl set 1 -diskpace 15G --save
and I did resize2fs to adjust the filesystem.

After doing this, I could copy files again to the container.

I checked df -h again, and I got this ouput:

```
/dev/ploop32515p1 15G 3.2G 11G 23% /
```

So again I am getting a lot of free space but I am not sure that the free space shown is correct.

Anybody got the same problem? Anybody knows what I can do to solve this?

In the /etc/vz/conf/1.conf file, I've set disk_quota=no.

Thanks for the reply!
