Hi everyone,

I wanted to restore a container running several websites, because I screwed something up.
So I restored using vzrestore to a different container-id, but the folder I was looking for was
missing.

How can that happen? Is there a chance to do an integrity-check of the backup?

Here is the command I'm using for backups
vzdump --snapshot --dumpdir /backup/vzdumps/ --compress --maxfiles 1 --tmpdir /vz/vztmp/
--bwlimit 50000 1016

```
ii  linux-image-openvz-amd64  042stab106.6
ii  vzctl                     4.8-2
ii  vzdump                      1.2.6-3
ii  vzquota                    3.1-1
ii  vzstats                    0.5.3-1
```

Thank you very much for your help.
