Hi
I have some servers running CentOS 6.7 + SolusVM, installed from OVH panel.
Actually I am using
Linux 2.6.32-042stab108.8 #1 SMP Wed Jul 22 17:23:23 MSK 2015 x86_64 x86_64 x86_64
GNU/Linux

This week I tried update linux and received 2 updates:

```
 ============================================================
============================================================
Package Arch Version Repository Size
 ============================================================
============================================================
Installing:
vzkernel x86_64 2.6.32-042stab111.11 openvz-kernel-rhel6 32 M
Installing for dependencies:
kernel-firmware noarch 2.6.32-573.3.1.el6 updates 18 M
```

BUT, when try install, I receive conflict errors from actual kernel.

I have another servers with online vzkernel + owp, and they were updates normally... but, all using solusvm, I cant update...

How to solve this ?
