Maybe you can try create a systemd startup script for vzquota that starts it after that process it is having trouble accessing. Creating systemd scripts are very simple compared to init.d scripts.

Try

systemd-anaylyze blame to see what is happening during the startup sequence and when vzquote is trying to start. With a systemd startup script you can change the order of when vzquota starts. Try move it down to the end. Maybe after rsyslog starts. It's very easy to do that in systemd scripts.
