Fix #3 is from the time in OpenVZ's history when it was possible to use vzpkg to build your own OS Templates from template def packages. That's how it is with the upcoming VZ7. In any event, just ignore that option. It should be obvious that it is ancient given the fact that it refers to centos-4 (EOLed Feb 29, 2012) OS Templates. It is basically saying along the lines of... add additional locales packages to your OS Templates so you aren't missing any.
