Hello,

I have a quite weird problem with a Ubuntu 16.04 (from https://download.openvz.org/template/precreated/ubuntu-16.04-x86_64.tar.gz) in Proxmox 3.4-14. The problem is when I start the VM, where only 3 process are running and there is no network, or any other service running.

Also, I can't perform a "shutdown -h now" because it throws:

Failed to connect to bus: No such file or directory
Failed to talk to init daemon.

It's very annoying
