Did you have to install the server as EXT4 file system? As I recall that was a major issue. Doing it this way goes against the staff of OpenVZ that want it installed from their ISO. Are you missing any features? vzbackup?

Lucky SB wrote on Tue, 16 August 2016 06:04i try on centos7

```
yum install -y vzkernel prlctl prl-disp-service libprlsdk-python vzstat
systemctl enable prl-disp
systemctl restart prl-disp
systemctl enable vz
systemctl restart vz
systemctl enable ksm
systemctl enable ksmtuned
systemctl enable libvirtd
systemctl restart ksm
systemctl restart ksmtuned
systemctl restart libvirtd
```

reboot

add VEFSTYPE="simfs" to /etc/vz/vz.conf

```
vzctl create 106 --ostemplate=centos-6
```

```
vzctl create 107 --ostemplate=centos-7
```

```
vzctl start 106
```

```
vzctl start 107
```

all fine

to restart container on reboot host-machine need packet libprlsdk-python
this install python sdk lib for /etc/vcmmd.d/vz python-script
