Hi,

I am reading RHEL documents and found that they do not recommend to use guest agents in production servers:

Quote: Note that it is only safe to rely on the QEMU guest agent when run by trusted guests. An untrusted guest may maliciously ignore or abuse the guest agent protocol, and although built-in safeguards exist to prevent a denial of service attack on the host, the host requires guest co-operation for operations to run as expected.

I wonder if any changes regarding this issue were made in OpenVZ 7?
