Hi All,

I need to reconfigure the network from scratch, and I'm not sure about a few things:

- 1. Do physical adapters need to be named a specific name? Should they be enpXsX or ethX or enoX? Does it matter?
- 2. Bridging with bonded interfaces. Should bonded interfaces be named the standard bondX?
- 3. Virtual interfaces: venet0, virbr0, and virbr0-nic all must exist?
- 4. Are all configs done via the ifcg-\* scripts or are there prictl methods for it?
