Not everything at once :) To tell the truth I think CPU controller  
is even more complicated than user memory accounting/limiting.

No, fair CPU scheduler is not tied to UBC in any regard.  
As we discussed before, it is valuable to have an ability to limit  
different resources separately (CPU, disk I/O, memory, etc.).  
For example, it can be possible to place some mission critical  
kernel threads (like kjournald) in a separate container.

This patches are related to kernel memory and nothing more :)

Thanks,  
Kirill
