Your operating system set limits on how many files can be opened by any running application on your host. You can extend the basic values usually 1024 easily by modifying 2 configuration files:

```
# vi /etc/sysctl.conf
```

```
fs.file-max = 32000
```

```
# vi /etc/security/limits.conf
```

```
youruser    soft  nofile 10000
```

```
youruser    hard  nofile 30000
```
