Hello,

I have a similar problem with the latest kernel.

Restarting openvz vps server hangs and only a mount is active, after that nothing works to stop or unmount that vps. Only reboot node fixes the problem.

When i boot with previous kernel restart or stop/start works great.

I discovered this problem when i was running a script to find certain files and change ownership and saw that i had memory allocation errors.

SLUB: Unable to allocate memory on node -1

cache: ext4_inode_cache, object size: 1056, buffer size: 1064, default order: 3, min order: 0

node 0: slabs: 4466, objs: 132900, free: 0

node 1: slabs: 1760, objs: 51477, free: 0

With both the latest kernel and the previous i get those errors.

Memory itself is ok.

CT-965 /# free -m

	total	used	free	shared	buff/cache	available
Mem:	6144	368	4680	29	1095	5388
Swap:	1024	0	1024
