After several days without problem, I must say that the solution proposed by khorenko worked. I disabled KMEM limits for all containers and now is everything stable again. I used this simple shell script:

```
for CTID in $(/usr/sbin/vzlist -H -o ctid|awk '{print $1;}');
```

```
do
```

```
    vzctl set $CTID --kmemsize unlimited --save
```

```
done
```
