It seems to be. At the end of 2017, our datacentre started using RAID controllers and motherboards with EFI that openvz kernels apparently couldn't support, so we had no choice but to use Virtuozzo Linux 7.

We've now migrated at least 40 containers from OpenVZ 6 to OpenVZ 7 host nodes, converting from SimFS to ploop in the process. It has worked out quite well with stable performance on nodes with up to 24 containers so far.
