Thaks for your answer.

I agree you include sometimes security fixes that are not yet in RHEL, bravo!

But as Nessus is detecting the RHEL one, and not openVZ one, it is creating some confusion.
For example, if I am using 042stab128.2, Nessus will tell me about vulnerabilities that are in
2.6.32-696.23.1.el6, even if you already fixed them in openVZ.
I would say it is normal behavior, nothing to discuss about that.

But may I consider 042stab128.2 secure? Probably not, as it is not the last version, and
042stab130.1 contains new security fixes.
So every time Nessus is reporting an issue with CentOS version, that probably means I am not
up-to-date on openVZ side.

Anyway, thanks for your answer.
