Dear fvafva,

usually containers have only one network interface, so net.ipv4.ip\_forward=1 is not required for them.

It can be useful if container have several interfaces, openvpn tunnel for example.

Such setting in containers are inherited from host,  
and can be adjusted via /etc/sysctl.conf inside guest.

in my new centos6 containers this sysctl is set to 0,  
because /etc/sysctl.conf in Os template overrides the setting inherited from host.

Thank you,  
Vasily Averin
