Dear fvafva,

usually containers have only one network interface, so net.ipv4.ip_forward=1 is not required for them.

It can be useful if container have several interfaces, openvpn tunnel for example.

Such setting in containers are inherited from host, and can be adjusted via /etc/sysctl.conf inside guest.

in my new centos6 containers this sysctl is set to 0, because /etc/sysctl.conf in Os template overrides the setting inherited from host.

Thank you,
Vasily Averin
