Hi,

Sorry for the delay, but I was away from work for some time. Meanwhile our team has stress tested OpenVZ 7 nodes by creating lot of random reads and writes on the ploop devices and then triggering pcompact. And we have been able to establish the pattern that with unpatched kernel we now regularly see the issue happening. Our planned next step was to apply the patch and see if the pattern will change. Unfortunately the link provided to patch for the 3.10.0-1127.8.2.vz7.151.14 kernel does not work anymore.

Could you please provide the link again. We could then apply the patch shortly and get back with the feedback about the status.

Best regards,

---
