Hi.

Yes, Virtuozzo 7 distro is based on CentOS 7 distro.

So if you miss some packages in Virtuozzo repo, you can add CentOS / epel repos and install packages.

And in 99% cases it will work.

Note: you better disable external repos after you install required packages,

because if you leave them enabled and some day later run "yum update" and in CentOS / epel repo will be

a package of newer version than we have in Virtuozzo repo and it will substitute a package which we in VZ distro have enhanced,
well, something might get broken.
