Compared the disp-helper package from 7.0.15 with the one in 7.0.16 release and it's clear that the logrotate config file 'collector' was the one that was added, whereas vz-event existed previously.

We're going to assume that collector is the one vz devs wanted there and vz-event was accidentally not removed when collector was added. This fixes it for each node:

```
[ -f /etc/logrotate.d/collector ] && rm -f /etc/logrotate.d/vz-event
```
