Hello Vasily Averin,

thank you for your reply. Unfortunately changing to root=/dev/sda1 does not help - the kernel panic still occurs. I have attached the grub.conf files (the one before I did the modification, and the one after I did the modification).

I can setup remote access for you now, if it helps. Just let me know - and I'll send you the remote access data via the private mail function of the forum. We have a Peppercon eRIC remote management card installed, so you can also go into the BIOS, power on / power off the server remotely...

Thanks for your friendly assistance,
we appreciate it very much,
best regards,
Werner
