AlmaLinux 9.4 includes an updated initscripts version 10.11.6 which requires network-scripts 10.11.6 as well:

Error:

Problem: cannot install both initscripts-10.11.6-1.el9.x86_64 from baseos and initscripts-10.11.5-1.el9.x86_64 from @System

- package network-scripts-10.11.5-1.el9.x86_64 from @System requires initscripts(x86-64) = 10.11.5-1.el9, but none of the providers can be installed

- cannot install the best update candidate for package initscripts-10.11.5-1.el9.x86_64

- problem with installed package network-scripts-10.11.5-1.el9.x86_64

(try to add '--allowrasing' to command line to replace conflicting packages or '--skip-broken' to skip uninstalleable packages or '--nobest' to use not only best candidate packages)

Yet the network-scripts package is only ever in the almalinux devel repo:

https://repo.almalinux.org/almalinux/9.3/devel/x86_64/os/Packages/

The original @System 'repo' the package came from refers to the EZTemplate it was installed from.

Anyone know if it's safe to simply install the package from the AlmaLinux devel repo, or if perhaps there are modifications to the package by OpenVZ devs to ensure it works with OpenVZ networking?
