I have no idea if any of the Virtuozzo devs even look here anymore, but on the off chance they do (and since we can no longer report bugs to the OpenVZ bug tracker):

The almaconvert8 utility no longer successfully converts to AlmaLinux - it takes the container to Virtuozzo Linux 8, and upgrades all vl8 packages, and stops there :(

This is when running it with the following environment:

- Freshly installed CentOS 7 from ez template on a totally new test container
- Host Node running OpenVZ release 7.0.22 (123) [all packages updated]
- Kernel: 3.10.0-1160.105.1.vz7.214.3
- vzdeploy8-1.1.6-2.vz7.noarch
