ok.

We don't have to tie the units with the number. We can leave it to be sorted out between the user and the controller writer.

Current implementation of resource groups does that.

Not necessarily. You could just set the CPU shares of the group and leave the other resources as don't care.

I do not see any `_guarantee_` support, only `barrier(soft limit)` and `limit`. May be I overlooked. Can you tell me how guarantee is achieved with UBC.
