Hi!

I've created my own template from a Debin Sarge 3.1 install.

Now if I do a /etc/rc.d/vz start after reboot my VPS has no IP.

vzctl enter ID
and then ifconfig outputs nothing

if i do then a
vzctl set ID --ipdel all --save
vzctl set ID --ipadd IP --save

everything works fine.

I can also do a /etc/rc.d/vz stop and then a start again... then it works without any problem. Only directly after reboot of the host system it does not work.

Any idea?

Stefan
