Hello i just setup a fresh dedicated server i'm trying to make a vps.

I successfully created the vps and i can enter it via vzctl enter

but i cannot access the server from the ip that i allocated it.

I dont think that the ip configuration on the node is setup for the ips that i will be using to make the vps.

Is there a specific file where i need to add the ips that i own so that they will work correctly when im creating vps's?
