Chris, you don't need to specify subnet mask for the IPs you are giving to your VEs as it is point-to-point connection with your HW node. Just add them to VE using "vzctl set <VPSID> --ipadd x.y.z.w --save" and check the connectivity.

If that doesn't work, provide outputs of the following commands on HW node (server):

ip a l
vzctl exec <VPSID> ip a l
cat /proc/sys/net/ipv4/ip_forward
