Subject: Dag / RPM Forge - Kludge found, is it tolerable ?

Hi all,

I posted a few months back in this topic, and hadn't worked too much on it until recently. Today on my "testbox" I found a workaround which seems OK but I wanted to verify that this wasn't going to cause weird problems.

Basically,

-install yum to the VPS
-inside the VPS use yum to install RPM of RPMFORGE setup files
-subsequently, from within the VPS I can do direct yum install of stuff from RPMForge/DAG Archive.

The "odd thing" I was hoping to confirm won't be the source of later grief: If I use the "vzyum" command from the physical host and do "vzyum 144 update" for example ... there is no sign of config associated with DAG /RPMForge. Presumably b/c this config resides in the physical host, and my kludge is within the VPS host.

I'm perfectly happy to do my RPM management WITHIN my VPS hosts exclusively after deployment in this case, since the server I'm working with will only have ~5 VPS hosts, all managed by me... it is done this way for security / consolidation (not a hosting environment or anything such!)

This approach seems "desirable" since my "production" system where I'll be doing this shortly .. is an opteron 64bit platform, and I gather the vzpkgcache utility isn't available for this platform, so I can't do the fix "the right way" (by rebuilding my cache at the physical host level... to include the dag/rpm forge info...) (unless I reinstall the machine as 32-bit platform, which I'm less keen to do at this stage).

Any comments are certainly appreciated. To clarify on this, I've pasted below exact output to illustrate the situation..

Many thanks,

--Tim Chipman

-----PASTE-------

note that the VZHost ID is "244" ; this whole setup is on my testbox (x86 not 64bit)

[root@vent ~]# vzyum 244 install yum

vzctl 244 enter

issue command:

rpm -Uhv http://dag.wieers.com/packages/rpmforge-release/rpmforge-rel
ease-0.3.4-1.el4.rf.i386.rpm

THEN:

```
[root@vent ~]# yum update

Resolving Dependencies
```

..etc... ie, we have access to RPMForge / Dag archive.

However: EXIT from vz ID 244 to host machine and try from there:

```
[root@vent ~]# vzyum  244 update
exec /usr/share/vzyum/bin/yum -c /vz/template/centos/4/i386/config/yum.conf --installroot
/vz/root/244 --vps=244 update
