To limit the memory i used a strange method...

In in my vps server (Hardware Node) i run the cat /proc/user_beancounters ... and dividi the number..

Example, i want to create a VPS of 256 MB of Ram in a hardware of 1 GB of ram

root@hardwarenode#cat /proc/user_beancounters

....
privvmpages   77431   77666   750000   825000
....

So i divide the Limit and the barrier by 4...

(All the numbers are illustrated)

Is too bad do it by this way ??

Thanks!!!
